Unit description

This unit covers: Routinely collected health-related data; quantitative methods in demography, including standardisation and life tables; health differentials; design and analysis of population health surveys including the roles of stratification, clustering and weighting. On completion of this unit students should be able to derive and compare population measures of mortality, illness, fertility and survival, be aware of the main sources of routinely collected health data and their advantages and disadvantages, and be able to collect primary data by a well-designed survey and analyse and interpret it appropriately. Because of the multi-institutional nature of the BCA units, there is an early cut-off for enrolment in this unit, which is typically one week before the start of the session. Please contact the program coordinator for details.

Important Academic Dates

Information about important academic dates including deadlines for withdrawing from units are available at https://www.mq.edu.au/study/calendar-of-dates

Learning Outcomes

On successful completion of this unit, you will be able to:

ULO1: derive and compare population measures of mortality, illness, fertility and survival, using basic demographic tools such as life tables and age standardisation
ULO2: access the main sources of routinely collected health data and choose theappropriate one, taking into account their advantages and disadvantages
ULO3: design a valid and reliable health survey to collect primary data
ULO4: choose the most appropriate mode of delivery for a survey
ULO5: design an efficient sampling strategy to obtain a random sample of the

targetpopulation

ULO6: estimate means, totals and proportions from survey data, taking into account thesample design, and analyse, interpret and present these results
