| Lecturer                         | Contact via Dialogue tool on the teaching website or during consultation |
|----------------------------------| E4A610 |
| Jackie Li                        | Wednesday 12-2 during teaching weeks |

| Credit points                   | 4 |

| Prerequisites                   | (ACST601 and ACST604) or (admission to MActPrac post 2014) |

| Corequisites                    | STAT806 or STAT810 |

| Co-badged status               | ACST356 and ACST861 share classes |

| Unit description               | This unit explores the use of statistical models in insurance: statistical models of the claim frequency and of claim size are studied. These models are a basis for the study of risk theory, ruin theory and reinsurance. Credibility theory is studied as a form of experience rating. Decision theory and simulation are also studied. Students gaining a grade of credit or higher in this unit and ACST862 General Insurance Pricing and Reserving may apply for exemption from subject CT6 of the professional exams of the Institute of Actuaries of Australia. |

### Important Academic Dates

Information about important academic dates including deadlines for withdrawing from units are available at [https://www.mq.edu.au/study/calendar-of-dates](https://www.mq.edu.au/study/calendar-of-dates)

### Learning Outcomes

On successful completion of this unit, you will be able to:
Describe, develop, apply and analyse the modelling of loss distributions both with and without limits and risk-sharing arrangements
Derive, apply, explain and analyse the concepts of Bayesian statistics including Empirical Bayes models
Construct risk models involving frequency and severity distributions and calculate the moment generating functions and moments both with and without risk-sharing arrangements. Develop research skills associated with this learning outcome.
Use Monte Carlo simulation to model observations from various loss models, calculate the number of simulations required and extend these techniques to more complex scenarios. Develop research skills associated with this learning outcome.
Define, explain and analyse the concept of ruin and describe the relationships between different probabilities of ruin including the effect of simple reinsurance arrangements. Develop research skills associated with this learning outcome.
Explain and apply the concepts of decision theory

General Assessment Information
It is the responsibility of students to view their marks for each within session assessment on iLearn within 20 working days of posting. If there are any discrepancies, students must contact the unit convenor immediately. Failure to do so will mean that queries received after the release of final results regarding assessment marks (not including the final exam mark) will not be addressed.

In the tests and exam, no dictionaries are permitted, and non-programmable calculators with no text storage/retrieval capacity are permitted. A Formulae Sheet will be provided, which must be returned.

Assessment Tasks

<table>
<thead>
<tr>
<th>Name</th>

</tr>
</thead>
<tbody>
<tr>
<td>Assignment</td>
<td>15%</td>
<td>11.55 pm, Sunday 22 May</td>
</tr>
<tr>
<td>Final exam</td>
<td>70%</td>
<td>Exam period</td>
</tr>
<tr>
<td>Class Test</td>
<td>15%</td>
<td>Tuesday 5 April</td>
</tr>
</tbody>
</table>

Assignment

Due: 11.55 pm, Sunday 22 May
Weighting: 15%

Written assignment worked on in groups of 3, 4 or 5 students, submitted in hardcopy form to BESS. ACST861 students will be required to complete a larger assignment than students in the
No extensions will be granted. There will be a deduction of 10% of the total available marks made from the total awarded mark for each 24 hour period or part thereof that the submission is late (for example, 25 hours late in submission – 20% penalty). This penalty does not apply for cases in which an application for disruption of studies is made and approved. No submission will be accepted after solutions have been posted.

On successful completion you will be able to:

- Describe, develop, apply and analyse the modelling of loss distributions both with and without limits and risk-sharing arrangements
- Derive, apply, explain and analyse the concepts of Bayesian statistics including Empirical Bayes models
- Construct risk models involving frequency and severity distributions and calculate the moment generating functions and moments both with and without risk-sharing arrangements. Develop research skills associated with this learning outcome.
- Use Monte Carlo simulation to model observations from various loss models, calculate the number of simulations required and extend these techniques to more complex scenarios. Develop research skills associated with this learning outcome.
- Define, explain and analyse the concept of ruin and describe the relationships between different probabilities of ruin including the effect of simple reinsurance arrangements. Develop research skills associated with this learning outcome.
- Explain and apply the concepts of decision theory

Final exam

Due: Exam period
Weighting: 70%

Three hour written exam held during the university exam period. To be eligible to pass this unit, a pass is required in the final examination.

On successful completion you will be able to:

- Describe, develop, apply and analyse the modelling of loss distributions both with and without limits and risk-sharing arrangements
- Derive, apply, explain and analyse the concepts of Bayesian statistics including Empirical Bayes models
- Construct risk models involving frequency and severity distributions and calculate the moment generating functions and moments both with and without risk-sharing arrangements. Develop research skills associated with this learning outcome.
• Use Monte Carlo simulation to model observations from various loss models, calculate the number of simulations required and extend these techniques to more complex scenarios. Develop research skills associated with this learning outcome.
• Define, explain and analyse the concept of ruin and describe the relationships between different probabilities of ruin including the effect of simple reinsurance arrangements. Develop research skills associated with this learning outcome.
• Explain and apply the concepts of decision theory

Class Test
Due: Tuesday 5 April
Weighting: 15%

In class test covering Sections 1 to 5 inclusive.

On successful completion you will be able to:
• Describe, develop, apply and analyse the modelling of loss distributions both with and without limits and risk-sharing arrangements
• Derive, apply, explain and analyse the concepts of Bayesian statistics including Empirical Bayes models

Delivery and Resources
The timetable for classes can be found on the University web site at:
https://timetables.mq.edu.au/2016/

Lectures are held on Tuesdays from 2 to 4 in E7BT5 and on Wednesdays from 11 to 12 in E7BT5. Tutorials are held on Thursdays 12 to 2 in E3A166.

For Sections 1 to 6 inclusive, Lecture Handouts (i.e. notes with gaps) will be available for downloading from the iLearn website. You will need to print the relevant section of the Lecture Handout in advance of the relevant lecture, and bring it to classes to complete. Complete Notes including solutions to Lecture Exercises and solutions to Section Exercises will be available for downloading from the iLearn page within 24 hours after the relevant tutorials covering that material have all been completed. This schedule is fixed and will not be varied for individual students unless the formal grounds for Disruption to Studies or Equity Support are met.

For Sections 7 to 11 inclusive, the required text is:

ActEd CT6 notes are not set as required or recommended reading for this unit, since the unit notes are comprehensive and detailed. The ActEd CT6 notes will also NOT be set as recommended reading for ACST357. If you decide to purchase the ActEd CT6 notes, please buy directly from ActEd. Those who want to view a copy of the ActEd CT6 notes during the session should contact the teaching assistant. Arrangements will be made for you to view them in the
Department of Applied Finance and Actuarial Studies. The notes are not available in the library. This reference copy of the notes cannot under any circumstances be photocopied.

Other useful references:

Technologies Used and Required
MS Excel and MS Word will be used throughout the unit. Students will be required to use a non-programmable calculator in the final examination and in the class test.

Policies and Procedures

Macquarie University policies and procedures are accessible from Policy Central. Students should be aware of the following policies in particular with regard to Learning and Teaching:

Academic Honesty Policy http://mq.edu.au/policy/docs/academic_honesty/policy.html

Disruption to Studies Policy http://www.mq.edu.au/policy/docs/disruption_studies/policy.html The Disruption to Studies Policy is effective from March 3 2014 and replaces the Special Consideration Policy.

In addition, a number of other policies can be found in the Learning and Teaching Category of Policy Central.

Student Code of Conduct

Macquarie University students have a responsibility to be familiar with the Student Code of Conduct: https://students.mq.edu.au/support/student_conduct/

Results

Results shown in iLearn, or released directly by your Unit Convenor, are not confirmed as they are subject to final approval by the University. Once approved, final results will be sent to your student email address and will be made available in eStudent. For more information visit ask.mq.edu.au.

Further information regarding supplementary exams, including dates, is available here http://www.businessandeconomics.mq.edu.au/current_students/undergraduate/how_do_i/special_consideration

Student Support

Macquarie University provides a range of support services for students. For details, visit http://students.mq.edu.au/support/

Learning Skills

Learning Skills (mq.edu.au/learningskills) provides academic writing resources and study strategies to improve your marks and take control of your study.

- Workshops
Graduate Capabilities

PG - Discipline Knowledge and Skills

Our postgraduates will be able to demonstrate a significantly enhanced depth and breadth of knowledge, scholarly understanding, and specific subject content knowledge in their chosen fields.

This graduate capability is supported by:

Learning outcomes

- Describe, develop, apply and analyse the modelling of loss distributions both with and without limits and risk-sharing arrangements
- Derive, apply, explain and analyse the concepts of Bayesian statistics including Empirical Bayes models
- Construct risk models involving frequency and severity distributions and calculate the moment generating functions and moments both with and without risk-sharing arrangements. Develop research skills associated with this learning outcome.
- Use Monte Carlo simulation to model observations from various loss models, calculate the number of simulations required and extend these techniques to more complex scenarios. Develop research skills associated with this learning outcome.
- Define, explain and analyse the concept of ruin and describe the relationships between different probabilities of ruin including the effect of simple reinsurance arrangements. Develop research skills associated with this learning outcome.
• Explain and apply the concepts of decision theory

**Assessment tasks**

• Assignment
• Final exam
• Class Test

**PG - Critical, Analytical and Integrative Thinking**

Our postgraduates will be capable of utilising and reflecting on prior knowledge and experience, of applying higher level critical thinking skills, and of integrating and synthesising learning and knowledge from a range of sources and environments. A characteristic of this form of thinking is the generation of new, professionally oriented knowledge through personal or group-based critique of practice and theory.

This graduate capability is supported by:

**Learning outcomes**

• Describe, develop, apply and analyse the modelling of loss distributions both with and without limits and risk-sharing arrangements
• Derive, apply, explain and analyse the concepts of Bayesian statistics including Empirical Bayes models
• Construct risk models involving frequency and severity distributions and calculate the moment generating functions and moments both with and without risk-sharing arrangements. Develop research skills associated with this learning outcome.
• Use Monte Carlo simulation to model observations from various loss models, calculate the number of simulations required and extend these techniques to more complex scenarios. Develop research skills associated with this learning outcome.
• Define, explain and analyse the concept of ruin and describe the relationships between different probabilities of ruin including the effect of simple reinsurance arrangements. Develop research skills associated with this learning outcome.
• Explain and apply the concepts of decision theory

**Assessment tasks**

• Assignment
• Final exam
• Class Test

**PG - Research and Problem Solving Capability**

Our postgraduates will be capable of systematic enquiry; able to use research skills to create new knowledge that can be applied to real world issues, or contribute to a field of study or
practice to enhance society. They will be capable of creative questioning, problem finding and problem solving.

This graduate capability is supported by:

**Learning outcomes**

- Describe, develop, apply and analyse the modelling of loss distributions both with and without limits and risk-sharing arrangements
- Derive, apply, explain and analyse the concepts of Bayesian statistics including Empirical Bayes models
- Construct risk models involving frequency and severity distributions and calculate the moment generating functions and moments both with and without risk-sharing arrangements. Develop research skills associated with this learning outcome.
- Use Monte Carlo simulation to model observations from various loss models, calculate the number of simulations required and extend these techniques to more complex scenarios. Develop research skills associated with this learning outcome.
- Define, explain and analyse the concept of ruin and describe the relationships between different probabilities of ruin including the effect of simple reinsurance arrangements. Develop research skills associated with this learning outcome.
- Explain and apply the concepts of decision theory
